                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                       diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (CVID) and acquired immunodeficiency common variable immunodeficiency and acquired immunodeficiency syndrome (AIDS)). ABB43990-ABB47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                This invention describes novel antibodies that immunospecifically bind to
                                                                                                                          Blymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiADS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and
                                                 Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GlyGluSerPheSerGlyTyrTyrTrpSerTrpIleArgGlnProProGlyLysGlyLeu 45

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 1343 and encodes a protein that is a member of the tumour corrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFv8) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including mysathenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and cutivities such as antirheumatic, antiathering cand cytostatic. This activities such as antirheumatic, antiathering cand cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the invention NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format con the printed specification, but was obtained in electronic format.
                                                                                                                                                                                                                                                                                                   Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -----GGATAT 17

cancer.

```
The present invention describes a protein comprising an immunoglobulin (1g) heavy chain variable (VH) domain and an Ig light chain variable (VL) domain. The protein blinds a complex comprising a major histocompatibility complex (WHC) and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the peptide in the absence of the MHC. The peptide is a peptide fragment of gp100, MUC1, TAX or hTERT. Also described: (1) a pharmaceutical composition comprising one or more nucleic acids for expressing the Ig that binds a complex having an MHC and a peptide, does not substantially bind the comprising one or more nucleic acids for expressing the Ig that binds a comprising an ence of the MHC; (3) an isolated nucleic acid comprising a first segment that encodes the Ig variable domain; (4) a comprising a first segment that encodes the Ig variable domain; (4) a comprising a first segment that encodes the complex acid sequences that encodes the novel protein; (5) a transgenic animal whose genome includes heterologous nucleic acid sequences that encode the protein; (6) identifying the protein that specifically binds the MHC-peptide complex; (7) expressing an antigen-binding protein; (8) ablating or killing a target cell that a complex in a sumplect, and (10) detecting an MHC-peptide complex in a sample. A protein of the invention has cytostatic activity, and can be used in gene therapy. The protein is useful for preparing a composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a peptide complex where the peptide component in as peptide an MHC-peptide complex where the peptide component in a septime therapent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein comprising an immunoglobulin heavy chain variable (VH) domain and an immunoglobulin light chain variable (VL) domain, useful for preparing a composition for treating or preventing a cancerous disorder.
                                                                                                                                                                                                                                                                                                                                                                                              (DYAX-) DYAX CORP.

transgenic Xenomice, created using the method of the invention. The specification describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin [Ig] locus, so that the mammal does not display normal B-cell development. The modified genome also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus in germline configuration, the human N-H genes and an inserted human J-H genes, and human D-H genes, human D-H genes, and human V-H genes and an inserted human kappa light chain Ig locus comprising a human kappa constant region, J-kappa genes, human Ig locus comprising a human kappa constant region, J-kappa genes, including both a multiple chain layer and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The transgenic animals have a near complete human Ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to particular antigens e.g. when exposed to human antibodies when exposed to particular antigens e.g. when exposed to human antibodies when exposed to particular will produce antibodies to IL-8, EGFR or INF- alpha respectively Human; immunoglobulin; Ig; transgenic; non-human mammal; inactivated endogenous Ig locus; B-cell development; Muman heavy chain Ig locus; micro constant region; J-H; D-H; V-H gene; kappa light chain Ig locus; kappa constant region; J-kappa gene; V-kappa; production; antibody. New transgenic non-human mammals - having an inactivated immunoglobulin locus and a near complete human immunoglobulin locus, used for production of human antibodies. 7 64 Mendez M, 3578 Amino acid sequence of a human antibody fragment. Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.
                                                                                                                                                                                                                                                                                  in nucleotide and predicted amino acid (see AAYOG691-94) sequences were compared with the closest known germline VH genes; for 4d76, this was RA. The results provided direct evidence that intrathecal clonally expanded Brecalls from the CSF of MS patients are hypermutated postgerminal centre antibody-forming or memory lymphocytes that havd undergone antigen selection. This finding implicates an important pathogenic pathway for the development of demyelination in CNS of MS. The invention provides assay kits for determining Becall or T-cell clonality. This technology cells in the CNS of patients, which is important for further understanding of the role of antigen(8) in the cause of B-cell clonal expansion, and towards developing antigen specific therapeutic strategy
                                                                                                                                                                                                                          This sequence represents a heavy chain variable region (VH) as predicted from DNA of dominant clone 4d76 of B-cells taken from the cerebrospinal fluid (CSF) of a multiple sclerosis (MS) patient. Sequences of VH of CSF B-cells were obtained from 4 MS patients (see AAX25316-19). Differences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determination of B-cell clonality by amplification or enzymatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                             The invention relates to a peptide or polypeptide comprising an FV molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and FV is a single chain FV (scFV) or a disulfide FV (dsFV). The peptide, optionally in association with or attached, complied, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, asrcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer composition for use in inhibiting the growth of a diseased or cancer composition for use in inhibiting the growth of a diseased or cancer coll. This sequence represents a human FV molecule hypervariable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antibody; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leuksemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                          Novel peptide/polypeptide for cancer therapy has Fv molecule, construct or fragment, or construct of fragment with enhanced binding characteristics so as to selectively bind target cell in favor of other

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenceis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia of tumour or leukaemia cells, increase in number of tumour or leukaemia of diseased cells to damage by anti-disease, anti-cancer or anti-cleukaemia agents, or for decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for disanosing and treating diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases, cardiovascular diseases mediated by abnormal platelet cumopathic diseases and other diseases mediated by abnormal platelet cuntonin and diseases caused by sulphated tyrosine-dependent protein-contein interactions. This sequence represents a human antibody fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  59
                                                                                                                                                                                                                                                                                       Novel isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or cardiovascular diseases, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              42 GlyLys----GlyLeu----GluTrplleGlyGlulleAsnHisSerGlySerThrAsnT

The invention describes a meribod of mananistic antibody.

Comparising making chimmeric antibodies contraining a complementarity determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of non-human antibody in comparison to germline canonical CDR structure types of human antibodies as the basis of selection, for humanisation. The method is useful for making a humanised antibody sequence of any subject species to a less converting a subject antibody sequence of any subject species to a less immunogenic form suitable for use in an object species. The method is reliable for identifying suitable human framework sequences to support on human CDR regions and to provide humanised antibodies that retain high antigen binding with low immunogenicity in humans, without the need for determining critically important amino acid residues in the framework, and without the need for multiple iteration and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparison framework sequences between non-human and human antibodies. This sequence represents a human heavy chain variable region gene segment used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               59
                                                                                                                                                                                                                                                                                                                                                                Making humanized antibody for converting antibody, by making chimeric antibodies containing complementarity determining region from non-human antibody and appropriate framework sequences of human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention describes a method of making a humanised antibody,
Human; heavy chain variable region; VH; humanised antibody; chimeric antibody; complementarity determining region; CDR; canonical CDR structure type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches:

The invention relates to a novel artificial single-stranded antibody library with superior-repertory. The library is created by using a CDNA library as template for amplifying a fragment containing the CD1 and CD2 regions of the VH or VL region of immunosolbulin gene and a fragment containing the CD3 region by PCR, respectively, producing VH and VL libraries, transferring into a host, and displaying the single-stranded antibody on a phase surface. An antibody library of the invention is useful as a tool in proteomics and antibody chips and filters, for screening ligands for antigens, and for studying protein-DNA interaction, diagnosis and treating various diseases. The present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                     The present invention describes a method for classifying a B-cell as malignant or normal comprising: (a) isolating a sequence representing an immunoglobulin (Ig) variable region from the B cell; (b) detecting the presence of a glycosylation site; and (c) classifying the cell as malignant or normal on the basis of the presence or absence of a glycosylation site. Also described: (l) treating a patient suffering from or at risk of having lymphoma; (2) screening for substances capable of inhibiting glycosylation of the Ig variable region of the B cell receptor inhibiting glycosylation of the type found in the germinal centre and N-glycans found on the surface of Ig of lymphoma cells. (s) has cycostatic activity, and can be used in gene therapy, and as a glycosylation inhibitor. The method is useful in classifying a B-cell as malignant or normal. The glycosylation inhibitor is useful in preparing a medicament for treating non-Hodgkin's lymphoma. The present sequence represents an Ig variable region sequence which is used in the cycostation of the present invention.
                                                                                                                                                                                                                                         Classifying a B-cell as malignant or normal by isolating a sequence representing an Ig variable region from the B cell, detecting the presence of a glycosylation site and classifying the cell as malignant or

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody especially the stability, or antigen blinding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody may be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                      physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position (s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention relates to a method for optimizing at least one

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least noe antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody especially the stability, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody way be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |||::: ||| GlyLys----GlyLeu----GluTrpIleGlyGluIleAsnHisSerGlySerThrAsnT

The invention relates to a method of producing a hybrid antibody or hybrid antibody fragment by: (i) providing an initial antibody having specificity for a target; (ii) determining the sequence of a variable region of the initial antibody; (iii) selecting a first component of the variable region consisting of FRI, FRZ, FRZ and FR4; (iv) comparing the sequence of the first component to sequences contained in a reference database of antibody sequences or antibody fragment sequences from a crarget species; (v) selecting a second component to sequence from an antibody in the database which demonstrates a high degree of homology to the first component; (vi) selecting a second component sequence from the group consisting of FRI, FRZ, FRZ and FR4; (vi) comparing the sequence of the second component sequences contained in a reference database of antibody sequences or antibody fragment sequences from the target species; (vii) selecting a sequence from the database which demonstrates a high degree of homology to the second component and antibody or the second component and antibody or sequences to one or more complementarity determining regions (CDRS) of the initial antibody, to produce a hybrid antibody or hybrid antibody fragment (claimed). The antibody and antibody fragment. The method is useful for producing a hybrid antibody fragment for the representations of the produces of the core in the core in the core in the core in the core of the core of the core in the core of antibody variable heavy or variable light chain to receive the CDRs. This produces antibodies that minital antibody endianced immunogenicity while minital antibody and antibody and antibody fragment. The method is useful for the second component and exhibit antibody variable heavy or variable light chain to receive the CDRs. This produces antibodies that minital antibodies and exhibit reduced immunogenicity while the content the content of the content and exhibit antibodies and exhibit reduced in the content and exhibit and the content of the content
                                                                                                                                                                                                                                                                                                                                            Producing a hybrid antibody or hybrid antibody fragment by operatively linking the selected framework sequences to one or more complementarity determining regions of the initial antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  maintaining an optimum binding profile. This sequence represents the amino acid sequence of an antibody from the VH gene locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; SEQ ID NO 83; 77pp; English

The invention relates to a method of preparing a lymphoid cell line capable of directed constitutive hypermutation of a target capable of directed constitutive hypermutation of a target nucleic acid mutation exceeds that of other nucleic acid mutation for cate of target nucleic acid mutation exceeds that of other nucleic acid mutation exceeds that of other nucleic acid mutation exceeds that of other nucleic acid mutation exceeds that of other nucleic acid mutation by a factor of 100 or more. The invention also relates to a method for preparing a gene product with a desired activity, comprising expressing a nucleic acid encoding the target gene operably linked to a sequence which directs hypermutation e.g., terminal deoxynucleotidyl transferase (TdT), in the lymphoid cell line, and identifying a cell or cells which express a mutated gene product with the desired activity. One or more clonal populations of the identified cells is established, and cells with an improved activity of interest are selected. These steps may be iteratively repeated until a gene product with a desired of the invention are used for directed constitutive hypermutation of a nucleic acid region in the preparation of a gene product, preferably an enzyme or an immunoglobulin (Ig) with a desired activity. In the exemplifications of the invention, IgM-secreting Ramos cells were selected for use as they undergo hypermutation during clonal expansion. This was determined on the basis of the amount of diversity in the heavy chain variable region (VH). Sequences AAB01949-B01954 which have lost the ability to bind anti-idlotype antibodies (anti-Idl Ab) relative to the wild-type VH (AAB01949). Note: The present sequence is not shown in the specification, but is derived to the wild-type VH (AB01949).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 7
847010
19 heavy chain V4.21-UniqueD-J5 region - human
C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Species: 13.-Jan.1995 #sequence_revision 13.-Jan.1995 #text_change 23.-Jul-1999
C;Accession: 547010
R;Mahmoudi, M.; Gasyna, E.; Denomme, G.; Edwards, J.; Bell, D.; Cairns, E.
submitted to the EMBL Data Library, July 1994
A;Description: The role of the immunoglobulin heavy chain in human anti-DNA antibody bin
A;Reference number: 547009
A;Accession: 547010
A;Status: preliminary
A;Molecule type: mRNA
A;Retus: preliminary
A;Molecule type: mRNA
A;Reserences: EMBL:235492; NID:9517254; PIDN:CAA84625.1; PID:9517255
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;15-97/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 6
